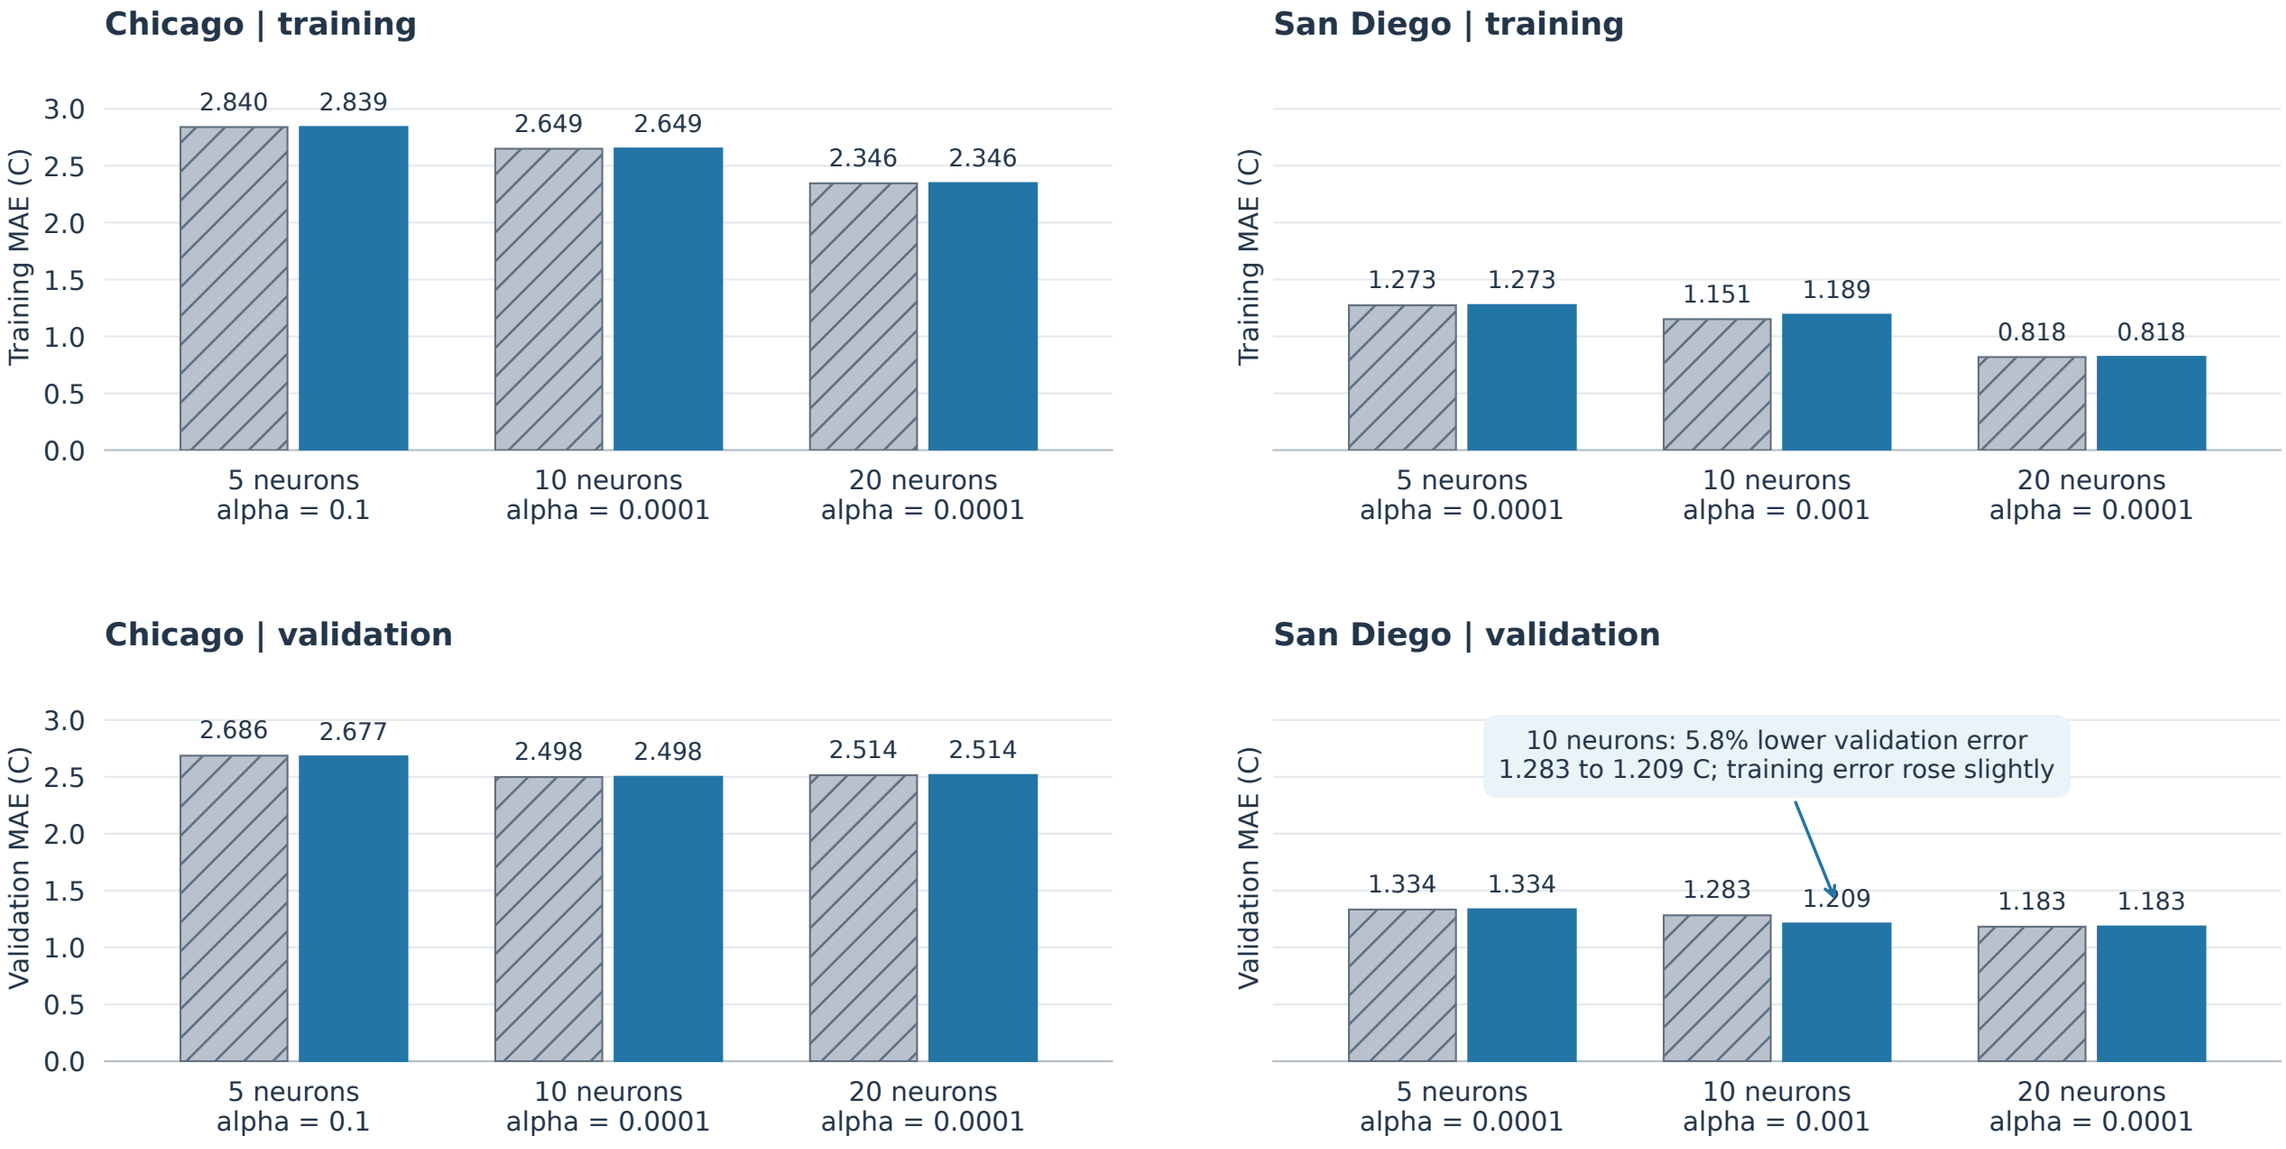
L2 tuning helped San Diego's 10-neuron model

Same 2009 ERA5 data and model sizes | Training and validation MAE | Lower is better

Before: original penalty (alpha = 0.0001) After: validation-selected penalty



After selects the lowest validation MAE from six tested penalties, including the original setting.

Alpha below each group is the selected penalty. Four of six models kept the original penalty.

281 training days; 84 month-end validation days; seed 0. Validation selects the penalty, so these are exploratory scores.
